

PlayGround

UNC paths will auto-format to links: (\\dc01\syse)
unless we tell it not to using nowiki tags:
\\dc01\syse

```
' '<nowiki>\\dc01\syse</nowiki>' '
```

BLUF

Bottom line up front. Follow these steps:

1. Get key steps to remember
2. Put them in ordered list format
3. Float that list in upper right of page

Include Sections from other Wiki Pages

{{section>gb:powershell:exchange#create_session_in_powershell}} resolves to this:

Auto-Replaced Text

The following sets of characters take advantage of the DokuWiki [Entities](#) feature to perform automatic text replacement:

- [`_`]: ☐
- [`x`]: ☒
- [`√`]: ☒ (NOTE: to enter the checkmark character, hold down `Alt` and enter 251 on the numeric keypad [further note: you **must** use the keypad; entering 251 using the top row of numbers on the keyboard will not work])

Syntax Reminders

Non-breaking spaces (` `) can be entered using `_`. This is managed via the `entities.local.conf` file.

This text¹⁾ needs a reference.

Wrap text in two single-quotes before and after to force "fixed-width font": `fixed-width font`. Fixed width text is easier to copy and paste than variable width fonts. Thus, filenames and other text we're likely to want to select should be entered with the fixed-width font.

Hiding/Folding Text

Hiding/Folding Text: Text  can be hidden/folded using three plus (+) signs as shown here: `+++Title|Text to hide+++` which gets rendered as: [Title](#) Text to hide

You can also hide entire blocks of text by using four plus (+) signs:

[Changes to the Default Folded Plugin Syntax](#)

The DokuWiki <https://www.dokuwiki.org/plugin:folded> originally used the `++title|content++` syntax to create inline foldable sections of content. However, this syntax conflicted with commonly used terms such as "Notepad++" and "C++", causing the plugin to misinterpret these terms as foldable content, leading to broken formatting and unexpected behavior.

To resolve this issue, we modified the plugin to use the `+++title|content+++` syntax for folding content.

Code Blocks

Here's a block of VBA code (added via `<code vb></code>`):

```
Public Sub HelloWorld()  
    Debug.Print "Hello, world!"  
End Sub
```

This is a file that can be downloaded (added via `<file text .hgignore></file>`):

`.hgignore`

```
syntax: glob  
*.twinproj
```

You can show code underneath an item in an ordered list without breaking the ordering by using the double-backslash to embed a newline after the item:

1. Item 1

```
SELECT 'Success!'  
FROM Dummy --see, we can embed line breaks in the SQL, too
```

2. Item 2

Keyboard Keys

Here are some keyboard keys: `Ctrl` + `C` to copy

WRAP Plugin

This is `some highlighted text`. Some `important text`. Full [Wrap plugin examples](#).

Here's a useful tip that doesn't really flow with the rest of the article. It's automatically indented 5% (by virtue of having a width of 90% and being centered).

There is a hidden comment in the source text for this line. It's added like this:
`<wrap hide>hidden comment</wrap>`

Use the "TODO" wrap block to embed "technical notes" in our product wiki pages:

TECHNICAL NOTES

This is a technical note that most users probably don't care about.

Email Links

Simple Mailto: (no body)

```
<html><a href="mailto:mike@grandjean.net?subject=A subject with spaces&body=Line 1%0D%0ALine 2&cc=anotheremailaddress@anotherdomain.com &bcc=onemore@anotherdomain.com">Advanced Mailto: (body, cc, and bcc)</a></html>
```

Images

tl;dr: Append the following text to pasted image tags: `?direct&150|`

Images can be copied and directly pasted into DokuWiki via the [imgpaste](#) plugin. The plugin will upload the media file from the clipboard, give it a unique name based on the current time, and insert the image tag text into the page at the current cursor location:

```
{ { :gb:pc:software:pasted:20240625-125043.png } }
```

Which will appear when rendered as follows:

Most of the time, we don't want large images to distract from the text. You can resize an image to make it smaller and create a link to the full-size image by appending the following text to the image tag inside the double curly braces:

`?direct&150|`

```
{ { :gb:pc:software:pasted:20240625-125043.png?direct&150| } }
```

This will render like so:

¹⁾
